#### Discussion

- 東南大學 南京 1902 東京
- What Operating System(s) are you familiar with?
- What is the best Operating System in your opinion? And for what features?

# **Objectives**

- To describe the basic organization of computer systems.
- To explain the evolution of operating system structures.
- To provide a grand tour of the major components of operating systems.
- To give an overview of the many types of computing environments.
- To explore several open-source operating systems.

# What Operating Systems Do What is an Operating System?

- A program that acts as an intermediary between a user of a computer and the computer hardware.
- Operating system goals:
  - Execute user programs and make solving user problems easier.
  - Make the computer system convenient to use.
  - Use the computer hardware in an efficient manner.

# What Operating Systems Do

#### Computer System Structure

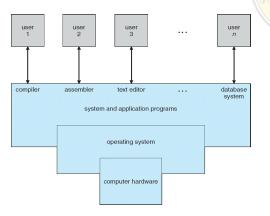

Computer system can be divided into four components:

- **Hardware** provides basic computing resources.
  - CPU, memory, I/O devices
- Operating system controls and coordinates use of hardware among various applications and users
- Application programs define the ways in which the system resources are used to solve the computing problems of the users.
  - Word processors, compilers, web browsers, database systems, video games
- Users
  - People, machines, other computers

## What Operating Systems Do

Computer System Structure (contd.)

We can explore operating systems from two viewpoints: that
of the user and that of the system.

# What Operating Systems Do User View

- Want convenience, ease of use and good performance.
- Don't care about resource utilization.
  - But shared computer such as mainframe or minicomputer must keep all users happy.
  - Users of dedicate systems such as workstations have dedicated resources but frequently use shared resources from servers.
  - Handheld computers are resource poor, optimized for usability and battery life.
  - Some computers have little or no user interface, such as embedded computers in devices and automobiles.

# What Operating Systems Do

#### System View

- OS is a resource allocator.
  - Manages all resources.
  - Decides between conflicting requests for efficient and fair resource use.
- OS is a control program.
  - Controls execution of programs to prevent errors and improper use of the computer.

# What Operating Systems Do

#### **Defining Operating Systems**

- No universally accepted definition.
- "Everything a vendor ships when you order an operating system"
  - is a good approximation,
  - but varies wildly.
- "The one program running at all times on the computer"
  - defines the kernel.
  - everything else is either
    - » a system program (ships with the operating system), or
    - » an application program.

#### Computer Startup

- Typically stored in ROM or EPROM, generally known as firmware.
- Initializes all aspects of system.
- Loads operating system kernel and starts execution.

#### Think of:

- What happens when a program runs / How instructions are executed?
- Millions/billions of times a second,
  - » the processor fetches an instruction from memory,
  - » decodes it,
  - executes it,
  - » moves on to the next till end.

#### Von Neumann Model

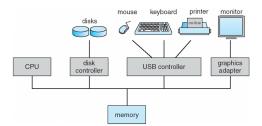

- We have just described the basics of the Von Neumann model of computing.
- "···an electronic digital computer with parts consisting of
  - a processing unit containing an arithmetic logic unit and processor registers;
  - a control unit containing an instruction register and program counter;
  - a memory to store both data and instructions;
  - external mass storage; and
  - input and output mechanisms."
    - Wikipedia "Von Neumann architecture".

Von Neumann Model (contd.)

The above Von Neumann Model defines/describes:

- How is a computer-system organized
  - One or more CPUs, device controllers connect through common bus providing access to shared memory.
- How is a computer-system operating
  - Concurrent execution of CPUs and devices competing for memory cycles.

#### Computer-System Operation

- I/O devices and the CPU can execute concurrently.
- But how?
  - Each device controller is in charge of a particular device type.
  - Each device controller has a local buffer.
  - CPU moves data from/to main memory to/from local buffers.
  - I/O is from the device to local buffer of controller.
- By now communication is enabled, but how to cooperate?
  - Device controller informs CPU that it has finished its operation by causing an interrupt.

#### Common Functions of Interrupts

- Interrupt transfers control to the interrupt service routine generally, through the interrupt vector, which contains the addresses of all the service routines.
- Interrupt architecture must save the address of the interrupted instruction.
- A trap or exception is a software-generated interrupt caused either by an error or a user request.
- An operating system is interrupt driven.

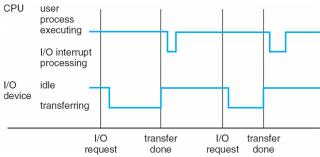

# Computer-System Organization Interrupt Handling

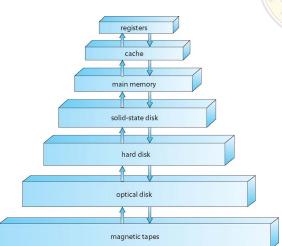

- The operating system preserves the state of the CPU by storing registers and the program counter.
- Determines which type of interrupt has occurred:
  - polling, or
  - vectored interrupt system
- Separate segments of code determine what action should be taken for each type of interrupt.

# Computer-System Organization Interrupt Timeline

Storage-Device Hierarchy

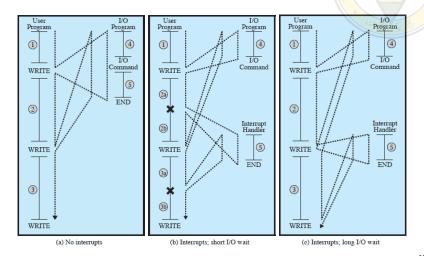

#### Storage Structure

- Main memory only large storage media that the CPU can access directly.
  - Random access.
  - Typically volatile.
- Secondary storage extension of main memory that provides large nonvolatile storage capacity.
- Hard disks rigid metal or glass platters covered with magnetic recording material.
  - Disk surface is logically divided into tracks, which are subdivided into sectors.
  - The disk controller determines the logical interaction between the device and the computer.
- Solid-state disks faster than hard disks, nonvolatile.
  - Various technologies.
  - Becoming more popular.

#### An Example of I/O Interrupts

I/O Structure — No Interrupts

- After I/O starts, control returns to user program only upon I/O completion
  - Wait instruction idles the CPU.
  - Wait loop (contention for memory access).
  - At most one I/O request is outstanding at a time, no simultaneous I/O processing.

I/O Structure — Interrupt Driven

- After I/O starts, control returns to user program without waiting for I/O completion
  - System call request to the OS to allow user to wait for I/O completion.
  - Device-status table contains entry for each I/O device indicating its type, address, and state.
  - OS indexes into I/O device table to determine device status and to modify table entry to include interrupt.
- Who returns the control?
  - Device Driver for each device controller to manage I/O.
     Provides uniform interface between controller and kernel.

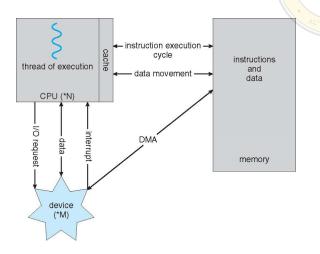

I/O Structure — Direct Memory Access

#### Direct Memory Access Structure

- Used for high-speed I/O devices able to transmit information at close to memory speeds.
- Device controller transfers blocks of data from buffer storage directly to main memory without CPU intervention.
- Only one interrupt is generated per block, rather than the one interrupt per byte.

- 9. Open-Source Operating Systems

- Most systems use a single general-purpose processor until 10 years ago.
  - Most systems have special-purpose processors as well.
- Multiprocessor systems growing in use and importance.
  - Also known as parallel systems, tightly-coupled systems.
  - Advantages include:
    - Increased throughput.
    - 2. Economy of scale.
    - 3. Increased reliability graceful degradation or fault tolerance.
  - Two types:
    - Asymmetric Multiprocessing each processor is assigned a specific task.
    - Symmetric Multiprocessing each processor performs all tasks.

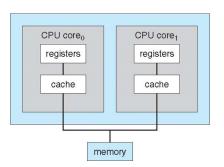

#### Symmetric Multiprocessing Architecture

#### A Dual-Core Design

- Multi-chip and multicore.
  - Why multicore?
  - On-chip communication is faster, uses significantly less power.
- Blade Servers: all in one chassis.
  - Chassis containing multiple separate systems.

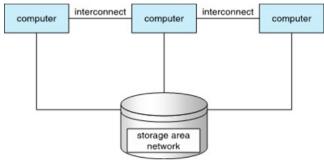

#### Clustered Systems

- Like multiprocessor systems, but multiple systems working together.
- Loosely-coupled systems.
  - Usually sharing storage via a storage-area network (SAN).
  - Provides a high-availability service which survives failures.
    - » Asymmetric clustering has one machine in hot-standby mode.
    - » Symmetric clustering has multiple nodes running applications, monitoring each other.
  - Some clusters are for high-performance computing (HPC).
    - » Applications must be written to use parallelization.
  - Some have distributed lock manager (DLM) to avoid conflicting operations.

# **Operating-System Structure**

#### Some History

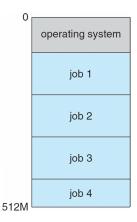

- No operating system. (1946 ~ 1955, ENIAC)
- A typical simple Batch system (since 1950s)
  - bring cards to IBM 1401
  - IBM 1401 read cards to tape
  - put tape on IBM 7094 which does computing
  - put tape on IBM 1401 which prints output

# **Operating-System Structure**

Some History (contd.)

- Multiprogramming (Batch system) needed for efficiency. (since 1960s)
  - Single user cannot keep CPU and I/O devices busy at all times.
  - Multiprogramming organizes jobs (code and data) so CPU always has one to execute.
  - A subset of total jobs in system is kept in memory.
  - One job selected and run via job scheduling (long term scheduling).
  - When it has to wait (for I/O for example), OS switches to another job.

# **Operating-System Structure**

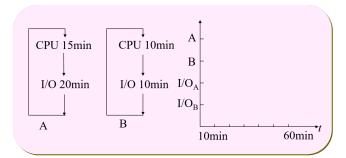

Some History (contd.)

- Timesharing (multitasking, since 1960s) is logical extension in which CPU switches jobs so frequently that users can interact with each job while it is running, creating interactive computing.
  - Response time should be < 1 second.</li>
  - Each user has at least one program executing in memory process.
  - If several jobs ready to run at the same time CPU scheduling (short term scheduling).
  - If processes don't fit in memory, swapping moves them in and out to run.
  - Virtual memory allows execution of processes not completely in memory.

#### In Class Exercise

#### Multiprogramming

- Consider a multiprogramming environment, two programs A and B share the system simultaneously, and run as follows. Suppose B runs first, I/O<sub>A</sub> and I/O<sub>B</sub> are different devices, and the time of switching between A and B can be ignored. Draw the timeline for these two programs, and calculate CPU utilization within 60 minutes.
- What if I/O<sub>A</sub> and I/O<sub>B</sub> are the same device?

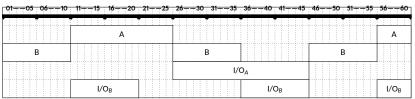

#### In Class Exercise

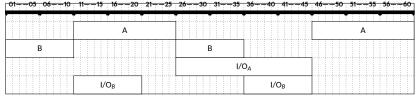

### Key to Multiprogramming

Key to Q1: CPU utilization = 50/60 = 83.33%

#### v2:

# **Operating-System Operations**

Interrupt Driven (hardware and software)

- Hardware interrupt by one of the devices.
- Software interrupt (exception or trap):
  - Software error (e.g., division by zero).
  - Request for operating system service.
  - Other process problems include infinite loop, processes modifying each other or the operating system.

# Operating-System Operations Dual Mode

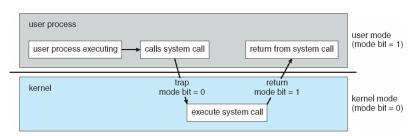

- 東南大學
- Dual-mode operation allows OS to protect itself and other system components.
  - User mode and kernel mode.
  - Mode bit provided by hardware.
    - » Provides ability to distinguish when system is running user code or kernel code.
    - » Some instructions designated as privileged, only executable in kernel mode.
    - » System call changes mode to kernel, return from call resets it to user.
- Increasingly CPUs support multi-mode operations.
  - i.e., virtual machine manager (VMM) mode for guest VMs.

# **Operating-System Operations**

Dual Mode (contd.)

#### Transition from User to Kernel Mode

# Operating-System Operations Timer

- Timer to prevent infinite loop / process hogging resources.
  - Timer is set to interrupt the computer after some time period.
  - Keep a counter that is decremented by the physical clock.
  - Operating system set the counter (privileged instruction).
  - When counter zero generate an interrupt.
  - Set up before scheduling process to regain control or terminate program that exceeds allotted time.

# **Operating-System Operations**

What Happens When the Computer System is Booting?

OS @boot	Hardware
(kernel mode)	
initialize trap table	
	remember addresses of
	system call handler
	timer handler
	illegal instruction handler
start interrupt timer	
	start timer; interrupt after X ms

# **Operating-System Operations**

What Happens When the Computer System is Running?

OS @run	Hardware	Program
(kernel mode)		(user mode)
to start process A:		
return-from-trap (into A)		
	move to user mode	
		process A runs:
		fetch instruction
		execute instruction
		•••
	timer interrupt	
	move to kernel mode	
	jump to interrupt handler

# Process/Memory/Storage Management Too Many Terms?

- Just remember three key ideas for now:
  - Virtualization: The OS takes a physical resource (such as the processor, or memory, or a disk) and transforms it into a more general, powerful, and easy-to-use virtual form of itself.
  - Concurrency: Many problems arise, and must be addressed, when working on many things at once (i.e., concurrently) in the same program.
  - Persistence: The OS makes information persist, despite computer crashes, disk failures, or power outages.

#### **Kernel Data Structures**

You Should Have Known the Concepts of ...

- arrays, lists, stacks, and queues,
- trees,
- hash functions and maps,
- bitmaps.

#### **Traditional Computing**

- Stand-alone general purpose machines.
- But blurred as most systems interconnect with others (i.e., the Internet).
- Portals provide web access to internal systems.
- Network computers (thin clients) are like Web terminals.
- Mobile computers interconnect via wireless networks.
- Networking becoming ubiquitous –even home systems use firewalls to protect home computers from Internet attacks.

#### Mobile Computing

- Hand-held smart-phones, tablets, etc.
- What is the functional difference between them and a "traditional" laptop?
- Extra feature more OS features (GPS, gyroscope).
- Allows new types of apps like augmented reality.
- Use IEEE 802.11 wireless, or cellular data networks for connectivity.
- Leaders are Apple iOS and Google Android.

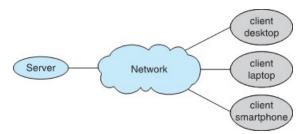

#### **Distributed Systems**

- Collection of separate, possibly heterogeneous, systems networked together.
  - Network is a communications path, TCP/IP most common.
    - Local Area Network (LAN)
    - » Wide Area Network (WAN)
    - » Metropolitan Area Network (MAN)
    - » Personal Area Network (PAN)
- Network Operating System provides features (such as file sharing) between systems across network.
  - Communication scheme allows systems to exchange messages.
  - Illusion of a single system.

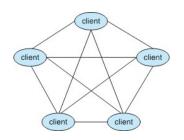

#### Client-Server Computing

- Dumb terminals supplanted by smart PCs.
- Many systems now servers, responding to requests generated by clients.
  - Compute-server system provides an interface to client to request services (i.e., database).
  - File-server system provides interface for clients to store and retrieve files.

Peer-to-Peer Computing

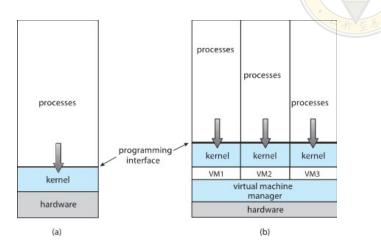

- Does not distinguish clients and servers.
  - Instead all nodes are considered peers.
  - May each act as client, server or both.
  - Node must join P2P network.
    - » Registers its service with central lookup service on network, or
    - » Broadcast request for service and respond to requests for service via discovery protocol.
  - Examples include Napster and Gnutella, Voice over IP (VoIP) such as Skype.

60/67

#### Virtualization

- Allows operating systems to run applications within other OSes.
  - Vast and growing industry.
- Emulation used when source CPU type different from target type (i.e. PowerPC to Intel x86).
  - Generally slowest method.
  - When computer language not compiled to native code Interpretation.
- Virtualization OS natively compiled for CPU, running guest
   OSes also natively compiled.
  - Consider VMware running WinXP guests, each running applications, all on native WinXP host OS.
  - Virtual machine manager (VMM) provides virtualization services.

Virtualization (contd.)

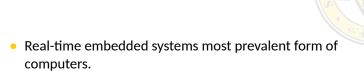

#### **Cloud Computing**

- Delivers computing, storage, apps as a service across a network.
- Logical extension of virtualization because it uses virtualization as the base for its functionality.
- Many types:
  - Public cloud available via Internet to anyone willing to pay.
  - Private cloud run by a company for the company's own use.
  - Hybrid cloud includes both public and private cloud components.
  - Software as a Service (SaaS) one or more applications available via the Internet (i.e., word processor).
  - Platform as a Service (PaaS) software stack ready for application use via the Internet (i.e., a database server).
  - Infrastructure as a Service (laaS) servers or storage available over Internet (i.e., storage available for backup use).

#### Real-Time Embedded Systems

- Vary considerable, special purpose, limited purpose OS, real-time OS.
- Use expanding.
- Many other special computing environments as well.
  - Some have OSes, some perform tasks without an OS.
- Real-time OS has well-defined fixed time constraints.
  - Processing must be done within constraint.
  - Correct operation only if constraints met.

# **Open-Source Operating Systems**

- Operating systems made available in source-code format rather than just binary closed-source.
- Counter to the copy protection and Digital Rights Management (DRM) movement.
- Started by Free Software Foundation (FSF), which has "copyleft" GNU Public License (GPL).
- Examples include GNU/Linux and BSD UNIX (including core of Mac OS X), and many more.
- Can use VMM like VMware Player (Free on Windows),
   Virtualbox (open source and free on many platforms available
   @ http://www.virtualbox.com)
  - Use to run guest operating systems for exploration.

# openEuler Operating System

- EulerOS is a commercial Linux distribution developed by Huawei based on CentOS source code for enterprise applications.
- Available @ https://openeuler.org/en/
